Agilent TS-5020
Automotive Electronics Functional Test System

Product Note

Test Engineering Challenges

On time test deployment within budget requires a test system that provides adequate test coverage and low test times while ensuring the manufacture of quality products. In developing a test platform, you must balance three competing challenges: time (test development, execution and system deployment); cost (capital and integration); and scope (throughput, accuracy and flexibility) [see Figure 1]. In today’s automotive electronics manufacturing environment, a reusable, scalable test platform helps meet evolving test requirements and lets you stay competitive.

There are three approaches for you to choose from when creating a test system: use your in-house test department to develop and build your own, outsource the development of an entire system, or use a commercial off-the-shelf platform as the basis for the test system to be deployed.

The Agilent TS-5020 is a new, off-the-shelf test platform tuned specifically for Automotive Electronics Functional Test. With the look and feel of the higher-end Agilent TS-5400 Series II, the TS-5020 addresses the requirement for a lower cost measurement system, catered to a medium pin count range with light duty switching.

Manufacturing Goals

Producing quality ECMs faster and at a lower cost without compromising test coverage can be a challenge in the fast-paced automotive electronics industry. In exploring the three competing goals of test engineering [see Figure 1] it becomes increasingly clear for the need to focus on each challenge individually, while simultaneously studying how they relate to one another. To meet the pressure in getting manufacturing test lines set up on time requires test engineering to perform faster test development, execution and line integration. In turn, increasing throughput to decrease the test cost per ECM requires faster test system to accommodate the rapid introduction of new convenience, security, safety and body electronic modules.

Achieving the proper balance among all the three goals is difficult yet necessary for manufacturers to better meet OEM timelines. In an effort to find this balance, where time is the ultimate constraint, manufacturers are forced to make decisions on trading test coverage, for maintaining a lean time to market. Either this, or manufacturers are forced to make decisions on trading wide ranging, flexible ECM test capability for module-dedicated test systems – a poor use of assets in the long term. Agilent’s new TS-5020 ensures that you do not have to trade off quality for test systems capability. The Agilent TS-5020 is a platform that allows for flexibility in scope, and maintains a low cost while simultaneously providing you a faster time to market.
The Agilent Solution

The TS-5020 Automotive Electronics Functional Test System helps manufacturers get products to market faster by accelerating test system deployment. Engineered with the three critical manufacturing goals in mind, this system caters for flexibility, speed and quality to automotive electronics production.

When it comes to flexibility, a universal test system core of both hardware and software can easily be modified to suit your particular test strategy and range of ECMs. As for speed and quality, the test executive accelerates both the development and execution of tests with over 400 test routines tuned towards automotive applications.

The Agilent TS-5020 is designed to provide performance at a lower cost for applications from simple ECMs such as climate control, immobilizers and RKE (remote-keyless entry), to safety ECMs such as airbag and ABS/TC.

The TS-5020 system comes equipped with measurement hardware, switching, a test executive and automotive tuned library routines. Racking, cabling and optional fixturing are included, as well as standard software development tools that enable test engineers to deploy test systems at a much faster rate than building test systems from individual components.

Agilent TS-5020 Automotive Electronics Functional Test System

At the heart of Agilent TS-5020 [see Figure 3] is the award winning Agilent 34980A Switch/Measurement Unit with a built in 6.5 digit multimeter. The system interface uses the Express Connect method. GPIB instruments can be optionally added to enhance the measurement capabilities of the system together with a range of power supplies.

Figure 3: Agilent TS-5020 Automotive Functional Test System

Key Features

Measurement Switching
The 34980A provides the switching platform for the TS-5020. To achieve a low cost, low pin count switching, the module supplied with the 34980A is configured as a 16x4x16 (16 instrument x 4 bus x 16 pin) switch matrix. Additional modules can be added and configured as 4x32 to increase the pin channel support up to 112 pins total.

Measurement
Keeping the TS-5020 a low cost system, the 34980A also offers a built-in DMM complete with independently configurable channels for the measurements you choose. This is a 61/2 digits DMM with a .004% of accuracy in DC voltage measurements, complete with channel alarms and math functions.

Load Switching
With its eight-slot mainframe, the 34980A can be added with a 20 channel “form A” switch to provide light duty load switching enabling it to support 3A continuous current with a 5A peak.

Mass Interconnect
The switching interconnects to the unit under test (UUT) via the Express Connect interface. This interconnect consists of an interface connect assembly (ICA) and an interface test adapter (ITA), each having its own connector blocks and matching pins. The ICA is mounted to the system rack and feature a hinged insert that when released, allows the panel to fold down 90° away from the system. This design allows convenient access to the wiring. The ITA inserts into the ICA and locks in place.
Additional Module Options for 34980

34933A Dual / Quad 4x8 Reed Matrix Module
Increases the pin count when required.

34938A 20 Channel 5A Form A Switch Module
A 20-Channel switch that allows for simple light duty load switching, supporting a 3A continuous current with a 5A peak.

3494xA Quad 1 x 4 RF Multiplexer Module
An RF multiplexer that offers bidirectional switching for test signals with high channel isolation. Available in 50 or 75 ohm inputs for 3GHz and 1.5GHz respectively.

34945A RF Switch/Attenuator Driver Module for 34980A
A switch/attenuator driver that allows control of switches and attenuators external of the system. The module provides power and control signals for many of the popular microwave switches and attenuators.

Additional Instrument Options

33220A Function / Arbitrary Waveform Generator
The 33220A uses direct digital synthesis techniques to create stable, low-distortion output signals that ensure accurate results. It offers 11 standard waveforms plus pulse and arbitrary waveforms. Custom waveforms can be created using the 14-bit, 50MSa/s, 84K-point arbitrary waveform function. The variable-edge pulse function, along with the PWM, provides excellent flexibility for automotive test applications.

53131A Universal Frequency Counter
The two-channel 53131A offers 10 digits per second of frequency or period resolution and bandwidth of 225 MHz. Time interval resolution is specified at 500ps. An optional third channel provides frequency measurements up to 3 GHz, 5GHz, or 12.4GHz. With fast signal processing and automated limit tests, the 53131A can make measurements such as frequency, rise/fall time, phase and more quickly and accurately.

66xxA DC Power Supply
This series of 200W linear-regulated DC power supplies is fully programmable via GPIB design to maximize the throughput of UUTs through the manufacturing test process with fast up and down programming time.

N67xxA Low-Profile Modular Power Supply System
A family of small and flexible modular power supply made of a low-profile, 1U high mainframe that accepts up to 4 modules with each module providing up to 300W of power. Fast command processing makes it ideal for product test environments.

Optional Instruments

34933A Dual / Quad 4x8 Reed Matrix Module for 34980A
34938A 20 Channel 5A Form A Switch Module for 34980A
34941A Quad 1 x 4 50 ohm 3 GHz RF Multiplexer Module for 34980A
34942A Quad 1 x 4 75 ohm 1.5 GHz RF Multiplexer Module for 34980A
34945A RF Switch/Attenuator Driver Module for 34980A
66xxA DC System Power Supply, 200W
N67xxA Low-Profile Modular Power Supply System, 50W-300W
33220A Function / Arbitrary Waveform Generator
53131A Universal Frequency Counter

Block Diagrams and Hardware Overview

The architecture of the TS-5020 utilizes a Windows XP Pro-based controller connected to the Agilent 34980A Multifunction Switch/Measure Mainframe with a choice of plug-in modules which include switching, D/A converters and a light load module.

The controller runs Agilent TestExec SL software, a mature test executive with hundreds of pre-tested automotive-tuned library routines.
Unique Attributes of Automotive Functional Testing

Functional testing of automotive Electronic Control Modules (ECM) can strain the capabilities of a typical test system. The TS-5020 can address a wide range of ECMS, from climate control to ABS to air bag control. Table 1 takes a closer look at the test requirements for some of these ECMS and the solution Agilent TS-5020 can provide.

Test Requirements

The advancement of electronically controlled functions in today’s automobiles require a wide range of capabilities: fast switching, versatile signal generation and serial communications; to name a few. The TS-5020 is designed to meet these challenges by increasing production volume with higher throughput while reducing the cost of test. As summarized in the table below, the TS-5020 offers a variety of solutions for each of the critical test requirements.

Test Methodologies

The ability to test many types of modules with one system improves development leverage. Adding test methodologies that accelerate the measurement of each module, regardless of type, is the next step towards lower-cost test.

The Agilent TS-5020 offers two approaches that improve the flexibility and speed of the testing process. One is UUT-assisted testing in which the ECM becomes an active participant in the testing process. The other is the throughput-multiplier strategy which enables batch testing of multiple identical ECMS.

UUT-Assisted Test

As shown in Figure 5 above right, most ECM designs include a serial interface. Communication protocols vary by manufacturer, but most comply with OBD2 standards. Variations include ISO-9141, J1939/CAN and J1850. The serial link is used in the automobile itself and can also assist in the testing of the module.

Figure 5: Example of Serial Interface for an Electronic Control Module (ECM)

As a programmable device, the ECM can be loaded with either operational code or test code. Operational code is either present in ROM during test or is downloaded when the unit is shipped. Test code is either included in ROM or downloaded through the serial link into the module. By using test code as part of the test program, the TS-5020 establishes a set of conditions to which the ECM responds. This test approach is known as UUT-assisted test.

Three modes

The TS-5020 enables three different modes for performing UUT-assisted test. The best choice of mode depends on the test stimulus source and response destination.

- **Serial Link Evaluation**: This mode simply evaluates the serial link and microcontroller. Commands sent to the microcontroller over the serial link prompt a response that is sent back to the test system. The system then verifies the response and may perform a full CRC memory check. Parametric tests may also be run to test serial link characteristics such as delay, rise or fall time, and input impedance.

- **I/O Status Evaluation**: This mode uses the test system I/O to determine ECM input states. It does this by sending a message over the serial link to the ECM prompting it to run a test routine. For example, this mode may be used to apply an analog input to the ECM to verify A/D conversion and the module’s handling and communication of data over the serial link. (For example, the analog input may be a simulation of a sensor’s output for air temperature.) In this mode, the test system can use UUT-assisted testing to assess proper functioning of several functions at once, including the controller, serial link, A/D and waveform processing circuitry.

- **Input Evaluation**: In this mode, the test system supplies an input then reads the value at either the input or output of the module. The evaluation can verify proper receipt of the signal at the module input or if the input cause the appropriate output.

Throughput multiplier

The throughput multiplier test strategy (multiple-up UUT testing) is one way to increase throughput for a manufacturing environment. Multiple UUT testing not only consolidates tasks common to multiple modules, such as load/unload, instrument setup of signal and load routing, it’s also an effective strategy for overlapping inherent latencies in the UUT or test system [shown in Figure 6 and 7].

Reduce total test cost

Test cost is only one factor in reducing the total cost of manufacturing an ECM. However, it is the tangible cost that can be reduced by test engineering to reduce cost times, equipment costs and floor space. The TS-5020 answers the call by delivering reduced integration costs, floor space and test times.

With the volume increase in safety, security and convenience modules, manufacturers are looking for ways to meet their line-production rate without building up inventory on the production line. Using the **throughput multiplier** for parallel multiple-up testing of ECMs not only reduces floor space and increases asset utilization, it decreases test times per ECM.

Instrumentation hardware is often believed to be the most significant contributor to test cost, but that may not always be the case. Hidden costs of software engineering time, operating costs and maintenance expenses must also be considered in the cost equation. Operation costs include management, facilities, and the skilled personnel needed to run the test systems. With a standard platform of hardware and software, support and training costs are lower than with a unique, custom-built system.

![Figure 7: Multi-uptesting of two or more UUTs](image-url)
System Software Reduces Development time

The TestExec SL software which comes with the TS-5020 provides a complete test development and test execution environment for the entire software development job. The test executive environment is tuned for functional testing of electronic devices in manufacturing. The software runs on a PC with Windows XP Pro for optimum performance, and comes pre-installed and ready to use. The TestExec SL development environment is ideal for creating ECM functional test plans. It consists of re-usable tests, measurements and utilities for performing specific functions related to automotive electronics functional test. Templates and examples are provided to serve as a starting point for creating tests. The Agilent test executive allows you to organize and order tests, reconfigure the test stand, profile the execution speed and debug tests. What’s more, the software test execution environment allows an operator to test up to N modules simultaneously (where N>1) and report test information back to the operator. Using the software utilities, the test executive can be easily linked with factory automation, bar code readers and printers.

The Agilent TestExec SL Software Development Environment

The hierarchical test development architecture encourages reuse to decrease development time on upcoming projects. The software provides an efficient and effective structure for developing the test plans and sequencing for functional test of automotive ECMs. Many measurements, tests and utilities are already provided as building blocks. Over 400 routines tuned towards automotive test provide maximum quality. A test engineering software team needs only create the test plan and sequencing from the integral building blocks of software, add customization for the manufacturer's specific ECM serial commands and create any customer test and/or measurements.

Find the right solution for your needs

To discuss your requirement in detail, please call your local Agilent office to arrange a consultation. To learn more about the TS-5000 family, visit us on the web at www.agilent.com/find/ts5020. The website also contains information about the full range of Agilent products and services that can help your engineering teams simulate and diagnose system performance in the design stage.
Remove all doubt

Our repair and calibration services will get your equipment back to you, performing like new, when promised. You will get full value out of your Agilent equipment throughout its lifetime. Your equipment will be serviced by Agilent-trained technicians using the latest factory calibration procedures, automated repair diagnostics and genuine parts. You will always have the utmost confidence in your measurements.

Agilent offers a wide range of additional expert test and measurement services for your equipment, including initial start-up assistance onsite education and training, as well as design, system integration, and project management.
